

STARS — Server Provisioning Request

Internal marketing-analytics web tool · lightweight Python (Streamlit) app · hosted on a Windows server

1 · MACHINE & SPECS

Operating system	Existing Windows server (Windows Server 2019/2022, or Windows 10/11 Pro). Can run on a shared box with spare capacity.
CPU	2 vCPU
RAM	4 GB available to the app
Free disk	~ 10 GB free (the app + Python + dependencies; no database server needed)

2 · SOFTWARE TO INSTALL

- **Python 3.11** (from python.org — tick “Add to PATH”)
- **Git for Windows**
- **NSSM** (to run the app as a Windows service — nssm.cc)
- **OpenSSH Server** (built-in Windows feature — enables automated deployments)

3 · NETWORK / FIREWALL

Inbound	Open TCP 443 (HTTPS) for users — or 8501 if access stays internal only.
Inbound (deploy)	TCP 22 (OpenSSH) — can be restricted to GitHub Actions / our IPs.
Outbound (required)	Allow outbound HTTPS (443) to the internet — specifically: <code>generativelanguage.googleapis.com</code> <code>analyticsdata.googleapis.com</code> <code>api.github.com</code>

⚠ **Most important:** the app makes **outbound** calls to the three domains above. If the server’s firewall blocks outbound internet by default, the app installs fine but will not function. Please confirm outbound HTTPS to those hosts is permitted.

4 · ACCESS & DOMAIN

Login account	A Windows admin account we can use, with OpenSSH access. We will provide an SSH public key for you to add.
Domain (optional)	A subdomain such as <code>stars.orientbell.com</code> with a DNS record pointing to this server, so the tool has a clean HTTPS URL. If internal-only, <code>http://SERVER-IP:8501</code> is acceptable to start.
HTTPS (if domain)	Standard IIS + Application Request Routing reverse proxy to <code>127.0.0.1:8501</code> with an internal certificate.

5 · PLEASE SEND BACK

- Server IP / hostname
- SSH username (we’ll supply the public key to authorise)
- Confirmation that inbound 443 (or 8501) and outbound 443 to the three domains are open
- The subdomain, once created (if applicable)

WHAT IT DOES NOT NEED

- No database server

DATA & SECURITY

- No inbound access to internal systems
- No GPU / heavy compute (AI runs on Google's cloud, off-server)
- App data (small text files) syncs to our private GitHub repo
- API keys stored in a local, restricted config file only
- Access protected by a shared team password

Full step-by-step install guide is maintained by the requester (deploy/SETUP.md). This sheet is the provisioning summary only. Questions → reply to the requester.
