

STARS — Server Provisioning Request

Internal marketing-analytics web tool · lightweight Python (Streamlit) app · hosted on Ubuntu Linux

1 · MACHINE & SPECS

Operating system	Ubuntu 22.04 LTS or 24.04 LTS (VM or physical). Can share a box with spare capacity.
CPU	2 vCPU
RAM	4 GB available to the app
Disk	~15 GB total (Ubuntu + app + Python deps; ~8 GB is the app itself). No database server needed.

2 · SOFTWARE (INSTALLED VIA APT DURING SETUP)

- `python3-venv` , `python3-pip` — Python 3.10+ runtime
- `git` — to pull the code
- `nginx` + `certbot` — reverse proxy & free HTTPS certificate
- (runs as a `systemd` service — no extra software)

3 · NETWORK / FIREWALL

Inbound	Open TCP 443 (HTTPS) and 80 (for the Let's Encrypt cert). Internal-only alternative: TCP 8501 .
Inbound (deploy)	TCP 22 (SSH) — can be restricted to GitHub Actions / our IPs.
Outbound (required)	Allow outbound HTTPS (443) to the internet — specifically: <code>generativelanguage.googleapis.com</code> <code>analyticsdata.googleapis.com</code> <code>api.github.com</code>

⚠ **Most important:** the app makes **outbound** calls to the three domains above. If the server's firewall blocks outbound internet by default, the app installs fine but will not function. Please confirm outbound HTTPS to those hosts is permitted.

4 · ACCESS & DOMAIN

Login access	A sudo-capable SSH account (or root) for initial setup. We'll also add a dedicated <code>stars</code> service user + an SSH key for automated deploys.
Domain (recommended)	A subdomain such as <code>stars.orientbell.com</code> with a DNS A-record pointing to this server's IP, so the tool has a clean HTTPS URL. Internal-only <code>http://SERVER-IP:8501</code> is also fine.

5 · PLEASE SEND BACK

- Server IP / hostname
- SSH username + how to authenticate (we can supply a public key)
- Confirmation that inbound 80/443 (or 8501) and outbound 443 to the three domains are open
- The subdomain, once created (if applicable)

WHAT IT DOES NOT NEED

- No database server
- No inbound access to internal systems

DATA & SECURITY

- App data (small text files) syncs to our private GitHub repo

- No GPU / heavy compute (AI runs on Google's cloud, off-server)
- API keys stored in a local, `chmod 600` config file only
- Access protected by a shared team password
- Runs as an unprivileged `stars` user, not root

Full step-by-step install guide is maintained by the requester (deploy/SETUP.md — Ubuntu). This sheet is the provisioning summary only.
